**Abstract**

Electricity supply to the Federal Polytechnic, Ilaro (FPI) communities continues to be major challenge. Many offices, laboratory and security lightning in the polytechnic community still run on generator because of the epileptic power supply from the national grid. The Department of electrical/electronic engineering installed some solar powered security lighting system to provide lighting during generator shutdown, this work presents a brief life-cycle-cost comparison of solar power supply system and petrol generator power supply system for various lighting applications in FPI. In this comparative analysis, conceptual designs were developed for solar power system and premium motor spirit (PMS) powered systems to meet the base-case load requirements. A case study for cost comparison of 1.5kVA, 3kVA and 4kVA solar power system and 1.5kVA, 3kVA and 4kVA equivalent PMS generator was considered. Economic assessment of providing 1.5kVA, 3kVA and 4kVA photovoltaic system in the polytechnic community was carried out and compared with that of 1.5kVA, 3kVA and 4kVA corresponding PMS generator. These two systems were compared for the period of four (4) years taking the cost analysis to obtain the total capital and operating cost. The result show that PV powered system would be more effective and economical in the running of practical's, street lightning and office use. The results show that PV is the cost effective option for low power energy demand for departmental office, laboratory and street lightning in the polytechnic community.

**KEY WORDS:** life-cycle-cost comparison; Photovoltaic (PV) power System; PMS generator;

**INTRODUCTION**

Electricity is critical to a country's economic development, and it is the backbone of any sustainable institution's curriculum delivery. Nigeria has been struggling to generate enough power to fulfill demand for decades. Because of the lack of electricity, the majority of higher education institutions are unable to carry out a significant portion of their academic activity. The country's rising unemployment rate can also be linked to the country's erratic electrical supply (Oluwaseun et al., 2018; Duque et al., 2017). Many of the country's higher education institutions have insufficient electricity. Small isolated petrol generators are used to provide the electricity demand in these locations. The operational expenses of these petrol generators may be excessively high due to rising petroleum prices and the noise they produce, as well as challenges in fuel delivery and generator maintenance. Renewable energy sources, such as solar photovoltaic (PV), offer a viable alternative to engine-driven generators for electrical delivery in laboratories and departmental offices, allowing for more efficient and effective learning. This paper present a detailed comparative analysis of using generator and solar photovoltaic systems: a case study of the department of electrical and electronic engineering (FPI).

**Sources of Renewable Energy**

Renewable energy is based on the principles of sustainability, renewability, and pollution reduction. Renewable energy resource management has gotten a lot of attention in the literature because of the balance sheet and expected energy shortages and environmental challenges. To address this issue, renewable energy sources must be used to replace traditional fuels because they deliver high electrical efficiency while having a low environmental impact (Jürgensen & Technology, 2015).

**Related Work**

Adejumobi et al., (2014) presented a number of factors that affect solar energy performance in Nigeria some of this factors are; High cost, lack of knowledge, insecurity, poor maintenance and lack of technical manpower  
Oluwaseun et al., (2018) compares biogas and solar energy for "Ajaba" near Ila-Orangun in Osun State to know the best renewable energy source for the area. The study considers photovoltaic cells as the device for trapping and converting solar energy to electrical energy while pig dung was used to prepare the digester materials for biogas energy and bio-digesters were used to convert the digester to electrical energy through dual ac generator. The simulation was carried out using MATLAB software to calculate the output energy. The result shows that biogas energy produced more energy and does better as compared to the solar energy for the area. Pradhan et al., (2013) focus on consideration of the economic and simulation for a stand-alone hybrid system having PV, wind and biomass for electrical production in remote areas. The average solar radiation, quantity of biomass, average wind speed for the remote area were taken for predicting the general performance of the generating system. The results obtained enhanced the performance of the model. Pradhan et al., (2013) presented economic consideration of solar PV and biomass for generation of electricity in remote areas. The average solar radiation and quantity of biomass required data that were used to predict the general performance of the generating system. The results and analysis

**The Federal Polytechnic, Ilaro, Fifth School of Engineering National Conference,  
Held Virtually, 8-10 November, 2021.**

improved the development of the model. Adejumobi et al., (2014) proposed a development of a grid-based rural electrification design for a rural environment such as Ishashi and Ilogbo communities in Lagos state, Nigeria using grid-based method. A load audit of the two communities was carried out to determine their energy demands. The proposed electrical model design for the two communities was implemented using AutoCAD Software. Furthermore, (Efunbote MI & Adeleke MB, 2015) designed hybrid solar-wind power system for a coaster area in Lagos State, south western Nigeria using HOMER software to simulate a solar and wind hybrid system. The result showed that the energy supplied using solar-wind hybrid power system was reliable and can produce electrical energy to power appliances in the community.

**Study Area**

Electrical Engineering department is situated in Ilaro town near papalanto in Ogun State, Nigeria. The place has a good potential for solar energy generation because it is easy to get enough amount of sun radiation. The solar irradiation in this area is around 1775 kWh/m<sup>2</sup>, which is also moderate for solar electricity generation (Wara & Abe, 2013).

**3.0. MATERIALS AND METHOD**

**3.1. Solar power Cost of installation and maintenance**

In this work, a detailed record of expenditures and maintenance cost of running a generator set were compiled and compared with solar power system in department of electrical/electronic engineering FPI. Table 1. Shows the expenses incurred installing a 1.5 kVa solar power system in control laboratory while table 2. Also shows the expenses incurred installing 3 kVa solar power system in electronic laboratory and table 3. Shows the expenses incurred installing 4 kVa solar power system in the departmental office of electrical/electronic engineering of FPI.

**3.2. Generator Cost of fueling and maintenance**

Data that comprises cost of fuelling, purchase of generators, servicing of generators and maintenance of engine-driven machine over a period of four years in order to ascertain the economic advantages of using solar energy systems over engine-driven machine were gathered.

**Cost of Fueling a 1.5 Kva Petrol Generating Sets**

Statutorily, the laboratory is used for a period of 8 hours per day on the average

For generating sets 150KVA, it was found that 1/4th of the rating such sets is the amount of fuel

Amount of petrol/ hour for 1.5 KVA, 1/4th of 1.5 KVA = 0.375ltr/hr

In a day, amount of petrol/day for 1.5 KVA = 8 x 0.375 = 3ltr/day

In a week, amount of petrol/week for 1.5 KVA = 7 x 3 = 21ltr/wk

In a year, amount of petrol/year for 1.5 KVA = 52 x 21 = 1,092ltr/year

For 3 years, amount of petrol for 4 years for 1.5 KVA = 4 x 1,092 = 4,368ltr/3 years

If petrol is @#165/ltr, then for 4 years, amount of fuel to be used = 4,368ltrs x #165 = **#720,720**

**Cost of Fueling a 3 Kva Petrol Generating Sets**

Statutorily, the laboratory and security lighting is used for a period of 8 hours per day on the average

For generating sets 150KVA, it was found that 1/4th of the rating such sets is the amount of fuel to be used per hour.

Hence, Amount of petrol per hour for 3KVA is 1/4th of 3KVA = 0.75ltr/hr

**The Federal Polytechnic, Ilaro, Fifth School of Engineering National Conference,  
Held Virtually, 8-10 November, 2021.**

In a day, amount of petrol/day for 3KVA =  $8 \times 0.75 = 6\text{ltr/day}$

In a week, amount of petrol/week for 3KVA =  $7 \times 6 = 42\text{ltr/wk}$

In a year, amount of petrol/year for 3KVA =  $52 \times 42 = 2,104\text{ltr/year}$

For 4 years, amount of petrol for 4 years for 3KVA =  $4 \times 2,104 = 8,416\text{ltr/4 years}$

If petrol is @#165/ltr, then for 4 years, amount of fuel to be used =  $8,416\text{ltrs} \times \#165 = \#1,388,640$

**Cost of Fueling a 4 Kva Petrol Generating Sets**

Amount of petrol/ hour for 4 KVA, 1/4th of 4 KVA = 1ltr/hr

In a day, amount of petrol/day for 4 KVA =  $8 \times 1 = 8\text{ltr/day}$

In a week, amount of petrol/week for 4 KVA =  $7 \times 8 = 56\text{ltr/wk}$

In a month, amount of petrol/month for 4 KVA =  $4 \times 56\text{ltr/wk} = 224\text{ltr/month}$

In a year, amount of petrol/year for 4 KVA =  $52 \times 56\text{ltr} = 2,912\text{ltr/year}$

For 4 years, amount of petrol for 4years for 4 KVA =  $4 \times 2912 = 11648\text{ltr/4 years}$

If petrol is @#165/ltr, then for four years, amount of fuel used =  $11,648\text{ltrs} \times \#165 = \#1,921,920$

**Table 4: The Total cost of Generator Sets**

**Cost of Generator Sets maintenance for period of 4years**

**5 CONCLUSION**

**The Federal Polytechnic, Ilaro, Fifth School of Engineering National Conference,  
Held Virtually, 8-10 November, 2021.**

This study shows that petrol generator can be considerably more expensive than solar power systems in long-term (upto 4years) due to high operating cost of petrol generator. The difficulty of purchasing spare part, servicing and fueling to keep it running make the petrol generator not economical. As we project into years the price of petrol is likely to go up while the price of PV system is likely to come down. It is also proved that PV system is environment friendly source of energy which should also be considered
